

Bug Report

Application: Trupeer.ai

Test Environment: Google Chrome 151, Windows 11

Total Issues Identified: 6

Priority Order: High → Medium → Low

Bug 1: Self-Referral Is Accepted by the Referral System

Severity: High

Steps to Reproduce:

1. Log in to the application.
2. Navigate to the Referral section.
3. Copy the referral link/code associated with the same account.
4. Use the same user's referral link/code to initiate a referral.
5. Complete the referral process.
6. Check the referral status.

Expected Behavior:

The system should prevent a user from referring to themselves and display an appropriate validation message.

Actual Behavior:

The system accepts the self-referral successfully without displaying any validation or error message.

Bug 2: Original Voice Generates Transcript in an Incorrect Language

Severity: High

Steps to Reproduce:

1. Open the application.
2. Record a video containing original voice narration.
3. Selected English as the recording language from the language dropdown.
4. Generate the script.
5. Review the generated transcript.

Expected Behavior:

The generated transcript should be in English, corresponding to the selected recording language and the original audio.

Actual Behavior:

The transcript is sometimes generated in an incorrect language. The generated script contains text in a different language from the original narration.

Bug 3: Audio Starts Late and Narration Is Cut Off Before Sentence Completion

Severity: High

Steps to Reproduce:

1. Open or record a video.
2. Open the video editor.
3. Add or generate scripts for the video.
4. Play the generated video from the beginning.
5. Observe the timeline and audio synchronization.
6. Continue playing until the end of the narration.
7. Compare the audio with the corresponding script/timeline.

Expected Behavior:

The narration should start at the correct timeline position and play completely until the sentence is finished. The audio, script, and video should remain synchronized.

Actual Behavior:

Sometimes the audio starts a few seconds late. In some cases, the narration is cut off before the sentence is completed, causing the ending portion of the sentence to be skipped. This results in the script and audio becoming out of sync.

Bug 4: Blank Scripts Are Generated Along With Timeline Segments

Severity: High

Steps to Reproduce:

1. Open the video editor.
2. Upload or select a video.
3. Generate the script.
4. Navigate to the timeline.
5. Review the generated script segments.

Expected Behavior:

Each timeline segment should contain valid script content corresponding to the video/audio.

Actual Behavior:

Blank script segments are sometimes generated and added to the timeline without any script content.

Bug 5: Video Duration Is Automatically Extended Without Explicit User Confirmation

Severity: Medium

Steps to Reproduce:

1. Open an existing video in the editor.
2. Add additional scripts between existing video segments.

3. Add a script that requires more duration than the available video length.
4. Observe the permission/confirmation prompt.
5. Check the video timeline and final video duration.

Expected Behavior:

The application should ask the user for explicit confirmation before extending the video duration. The video length should only be extended after the user grants permission.

Actual Behavior:

When a script requires more time than the available video duration, the application automatically accepts the extension without waiting for explicit user confirmation. As a result, the video duration is automatically extended.

Bug 6: Find and Replace Is Case-Sensitive

Severity: Low

Steps to Reproduce:

1. Open the script editor.
2. Enter text containing uppercase and lowercase characters, for example, "Testing".
3. Open Find and Replace.
4. Search for the same text using a different case, such as "testing".
5. Observe the search results.

Expected Behavior:

Find and Replace should either perform a case-insensitive search by default or provide a clear option to enable or disable case sensitivity.

Actual Behavior:

The Find and Replace functionality is case-sensitive. Searching for text with a different letter case does not identify the matching text.
